So far we have looked more or less exclusively at finite clauses. We now turn our attention to infinitival clauses.

We will look at the following three cases:

1. Control: the subject of the infinitival is a null pronoun called PRO:
   - David tried [PRO to dance].
   - [PRO to dance with David] is fun.
2. Raising: the subject of the infinitival moves to a higher subject position:
   - Makoto appears [tips to be happy].
   - Joey seems [tips to be exhausted].
3. ECM: the subject of the infinitival is an overt NP:
   - I believe [Angela to be innocent].
   - Minjoo wants [him to stay].

1.1 Some motivation for PRO

Given our assumptions about θ-roles and the EPP, we need to assume that there is a null subject in the infinitival clauses under discussion. What could this subject be?
Some null DPs:

(4) a. DP-trace/copies of DPs that we do not pronounce
   b. pro - a null pronoun that needs case
   c. PRO - a null pronoun that does not need case

• An important theoretical consideration:

(5) \(\theta\)-criterion: An argument DP must receive a \(\theta\)-role, and may receive only one \(\theta\)-role.

The only one \(\theta\)-role requirement rules out movement and hence DP-traces/copies of DPs in the infinitival subject in the infinitival subject position.

pro could be a possibility (see Borer (1989)), but pro as generally conceptualized can only appear in positions where it can get case and where overt DPs may also appear.

If we keep to the only one \(\theta\)-role part of the \(\theta\)-criterion, we need to postulate a new kind of entity - a null pronoun, called PRO, which can satisfy the EPP requirement, receive a \(\theta\)-role, and which does not need case.

(6) a. Junko, decided [PRO, to visit UMass in December].
   b. Fred, promised Alex [PRO, to finish his paper by Monday].
   c. Fred persuaded Alex, [PRO, to finish her paper by Monday].
   (The co-indexing indicates what DP controls the PRO. If the proposal that this relationship is essentially a semantic one is correct, then these indices do not need to be represented in the syntax.)

As always, once we postulate a null entity we have to make sure that it appears only where we want it to appear. This will be an important aspect of our discussion.

1.2 Control as Raising

Control and Raising are generally taken to involve different modules of the grammar - control theory and movement, respectively.

Control Theory, however, remains poorly understood and there has been an active line of work originating in Hornstein (1999), which tries to derive Control via movement. To derive Control via movement, the only one \(\theta\)-role part of the \(\theta\)-criterion must be given up.

Note that deriving Control via Movement is not the same thing as saying that Raising and Control are the same. There is no denying that there are many many properties on which control constructions differ from raising constructions.

Landau (2003) suggests that since control constructions are very different from raising constructions, we want to keep the derivation of the two distinct. In their reply to Landau (2003), Boeckx
and Hornstein (2004) point out that there are in fact certain parallels between control and raising and claim that the non-parallels can be derived from independent differences between raising and control.

1.3 Different Kinds of Control

Control construction can be subdivided along several dimensions. Some of these subclasses seem more amenable to a movement analysis than others.

1.3.1 Subject vs. Object Control

(7) Ditransitive control predicates:
   a. subject control: Fred promised Alex to finish his paper by Monday.
   b. object control: Fred persuaded Alex to finish her paper by Monday.

There are many object control predicates but very few subject control predicates. This has led some researchers to propose a Minimal Distance Principle, which forces object control (cf. Rosenbaum (1967)). MDP-violating subject control is taken to involve a special structure where the Minimal Distance Principle is in fact respected (cf. Larson (1991)).

The conclusion (most?) other researchers have reached is that while the availability of a control relationship is a property of the syntax, the exact identity of the controller (subject vs. object) follows from the semantics of the embedding predicate (cf. Dowty (1985), Culicover and Jackendoff (2001), Jackendoff and Culicover (2003) among others) The intuition expressed by Dowty is that there could not be a verb that had the same meaning as promise, but which was object control (and vice versa). Facts from acquisition add an additional twist to this discussion - MDP violating subject control verbs like promise seem to be acquired much later (see Boeckx and Hornstein (2003)).

1.3.2 Obligatory, Arbitrary, and Optional Control

Most of the cases of control seen so far involve obligatory control i.e. the subject of the infinitival clause can only be interpreted as dependent on an argument of the embedding predicate for its interpretation.

(8) Obligatory Control:
   a. Infinitival (non-wh)-Complements:
      i. Angela tried [to disinvite him].
      ii. Fred promised Alex [to finish his paper by Monday].
      iii. Fred persuaded Alex [to finish her paper by Monday].
   b. Infinitival Adjuncts:
      i. Andre read Rushdie’s article about Coetzee [to make a presentation in his class].
      ii. Roumi went to Tromsoe [to talk to Sylvia].

Not all instances of control are obligatory - in some cases the PRO seems to lack an obvious controller and takes on a generic/arbitrary interpretation - these cases are referred to as PRO_{arb.}

1But see Epstein (1984) and Bhatt and Izvorski (1997) who argue that even in these cases, there is an implicit controller.
Arbitrary control is diagnosed by its ability to bind oneself and the availability of a paraphrase that involves the pronoun one.

(9) Arbitrary Control:
   a. - unique argument of embedding predicate:
      i. [PRO$_{arb}$ to walk along Paradise Pond in the Fall] is fun.
      ii. [PRO$_{arb}$ to behave oneself in public] is important.
      iii. It is not allowed [PRO$_{arb}$ to perjure oneself].
   b. - part of a $wh$-CP:
      i. Minjoo knows [how PRO$_{arb}$ to behave oneself in public].
      ii. Tim wonders [how PRO$_{arb}$ to protect oneself from creditors].

In some cases, such as when the infinitival clause is embedded in a $wh$-CP, arbitrary control is not the only option:

(10) optional control:
   a. Minjoo$_i$ knows [how PRO$_i$ to behave herself in public].
   b. Tim$_i$ wonders [how PRO$_i$ to protect himself from creditors].

For obvious reasons, these cases are referred to as involving optional control.

Landau (2000)/Landau (2003) makes a further distinction noting that the PRO subject of initial adjuncts can be interpreted as non-arbitrary and yet not controlled by the matrix subject.

(11) Non-Obligatory Control (NOC)
   a. Mary$_i$ was baffled. [Even after PRO$_i$ revealing her innermost feelings], John remained untouched.
   b. Mary$_i$ lost track of John$_j$, because, [PRO$_{i,j}$ having been angry at each other$_{i,j}$], he had gone one way and she another.
   c. [Having PRO$_i$ just arrived in town], the main hotel seemed to Bill$_i$ to be the best place to stay.

He argues that the $wh$-infinitival cases of arbitrary control are really special cases of partial control and should not be mixed with cases of NOC like the above. In the $wh$-infinitival cases, even the arbitrary PRO must include the subject in its reference. True disjoint reference is not allowed.

(12) a. John$_i$ wondered [who PRO to introduce his$_i$ fiancee/*him$_i$ to].
    b. John$_i$ asked [how PRO to talk to Mary/*him$_i$ about oneself].
1.3.3 Partial vs. Exhaustive Control

There is also a class of cases where the matrix predicate provides only part of the reference of the subject of the infinitival clause (see Landau (2000) for details).

(13) Partial Control:
We thought that ....
   a. He wanted [PRO to meet in the lobby/do the dishes together].
   b. The chair preferred [PRO to gather at 6].
   c. Bill regretted [PRO, meeting without a concrete agenda].
   d. Mary wondered [whether PRO to apply together].

Other predicates do not allow partial control.

(14) a. *Bev began [PRO to do the dishes together].
   b. *The chair managed [PRO to gather at 6].

1.3.4 Implicit Control

The controller of PRO can be an implicit argument - i.e. an argument that does not seem to be syntactically projected. Languages differ in the extent to which they allow for implicit arguments to control a PRO.²

(15) Unaccusative vs. Passives
   a. No implicit argument, No Control:
      * The ship sank [PRO to collect the insurance].
   b. Implicit agent, Control:
      The ship was sunk [PRO to collect the insurance].

(16) Implicit accusatives vs. Implicit datives:
   a. Implicit Accusatives:
      This leads *(one) [PRO to draw the following conclusion].
   b. Implicit Datives:
      John said/shouted (to the visitors) [PRO to return later].

(Unlike English, both are good in Italian. See Rizzi (1986).)

²There is a generalization called Bach’s Generalization according to which object controllers may not be omitted. Bach’s Generalization holds as long we restrict ourself to accusative object controllers. Dative object controllers may be implicit.
1.4 Some Properties of Control Constructions

(Setting aside cases of NOC. For that see Landau (2001))

• The controller can never be an expletive.

(17) a. *There, tried [PRO, to annoy David].
   b. *It, hopes [PRO, to win]. (with expletive it)

This is a definitional property of control.

• The PRO is always a subject.

(18) a. He, tried [PRO, to annoy David].
   b. *He, tried [David to annoy PRO,].
   c. He, tried [PRO, to be annoyed at David].

• The controller of PRO needs to be an argument of the predicate to which the infinitival clause is attached.

(19) a. He, thinks [that I, tried [PRO, to annoy David]].
   b. He, thinks [that I, persuaded Mildred, [PRO, to leave]].

(20) c-command (follows from argument requirement and the fact that the clausal complement is the innermost argument)
   a. [His, parents,] tried [PRO, to annoy David].
   b. I, persuaded [Mildred, ’s mother,] [PRO, to leave].

• PRO cannot be a real expletive.

(21) a. [For Mary to dance] would be fun.
   b. [PRO to dance] is fun.
   c. [For there to be a party tonight] would be fun.
   d. *[PRO_{expl} to be a party tonight] would be fun.
   e. [For it to seem that Mary is a non-smoker], she will have to get new rugs.
   f. *[PRO_{expl} to seem that Mary is a non-smoker], she will have to get new rugs.

(22) (from Lasnik (1992):244)
   a. [*There having been a robbery], there was an investigation.
   b. There was a crime without [*there being a victim].
   c. [PRO, having witnessed the robbery], John, aided the investigators.
   d. Harry, was a witness without [PRO, being a victim].

But PRO can function as weather/pseudo-ambient it:

(23) a. It can hail [without it snowing].
   b. It can hail [without PRO, it snowing].
