1.	A Very General Substitution Theorem About Semantics of CFOL.....	9

1. Introduction

Having described the syntax and semantics for classical first-order logic, the next task is to offer a deductive account of argument validity in CFOL.

We approach this task in steps. First, we axiomatize classical quantifier logic (CQL), which is a major “fragment” of CFOL, then we axiomatize classical first-order logic. This is not entirely crazy; we have already adopted this strategy in concentrating on the SL-fragment of CFOL in previous chapters. The language for CQL is like the language of CFOL, except that it lacks identity.

We further fragmentize our chief meta-theorems for CQL. First, we prove the results for classical predicate logic (CPL), then we prove the results about CQL. The difference is not the axiom system but the underlying language – CPL is like the language of CQL, except that it lacks function signs [except zero-place, which are functionally identical to proper nouns].

We also adopt three convenient, and natural, simplifications of classical first-order logic (and its fragments).

- Simplification #1: no open formulas in arguments;
- Simplification #2: no open formulas in derivations;
- Simplification #3: no constants in arguments.

Simplification #1 is natural if we agree that, although an open formula \mathbb{F} has a meaning, which contributes to the meaning of any super-formula of \mathbb{F} , it does not strictly speaking have a denotation (i.e., truth-value). We can therefore claim that, since validity amounts to truth-preservation, validity does not strictly apply to open argument forms. Simplification #2 is the natural extension of #1. Simplification #3 is natural if we agree that constants are purely intra-derivational devices [\exists O, UD, etc.], and accordingly do not appear in any proper argument we wish to analyze. In this connection, recall that constants are not proper nouns, but rather unquantified variables (alternatively, *ad hoc* names).

2. An Axiom System for CQL – AS1+Q

The axiom system we discuss is obtained by taking axiom system AS1 for CSL, and adding rules for quantification, and is accordingly called AS1+Q. Notice that all the rules are restricted to closed formulas of the language \mathbb{L} .

AS1 Rules:

In the following, α, β, γ are closed formulas.

- (R1) $\hookrightarrow \alpha \rightarrow (\beta \rightarrow \alpha)$
- (R2) $\hookrightarrow [\alpha \rightarrow (\beta \rightarrow \gamma)] \rightarrow [(\alpha \rightarrow \beta) \rightarrow (\alpha \rightarrow \gamma)]$
- (R3) $\hookrightarrow (\sim \alpha \rightarrow \sim \beta) \rightarrow (\beta \rightarrow \alpha)$
- (R4) $\alpha, \alpha \rightarrow \beta \hookrightarrow \beta$

New Rules:

In the following, \mathbb{F} and \mathbb{G} are formulas, v is a variable, c is a constant, and τ is a singular term.

- (R5) $\hookrightarrow \forall v \mathbb{F} \rightarrow \mathbb{F}[\tau/v]$ τ is a closed singular term; at most v is free in \mathbb{F}
 (R6) $\hookrightarrow \mathbb{F} \rightarrow \forall v \mathbb{F}$ \mathbb{F} is closed
 (R7) $\hookrightarrow \forall v (\mathbb{F} \rightarrow \mathbb{G}) \rightarrow (\forall v \mathbb{F} \rightarrow \forall v \mathbb{G})$ at most v is free in \mathbb{F} and \mathbb{G}
 (R8) $\pi(\mathbb{F}) \hookrightarrow \forall v \mathbb{F}[v/c]$ $\pi(\mathbb{F})$ is a prior sub-sequence that proves \mathbb{F} [closed]

If one is inclined to give names to rules, the following might be considered.

- | | | |
|------|-------------------------------------|--------------------|
| (R1) | repetition | Rep |
| (R2) | conditional distribution | \rightarrow Dist |
| (R3) | (non-intuitionistic) contraposition | Contra |
| (R4) | modus ponens | MP |
| (R5) | universal elimination (out) | \forall O |
| (R6) | trivial quantification | TrivQ |
| (R7) | universal distribution | \forall Dist |
| (R8) | (provable) generalization | Gen |

3. Simple Examples of Derivations in AS1+Q**1. $\vdash \text{" } x(\mathbb{F}x \textcircled{R} \mathbb{F}x)$**

- | | | | |
|-----|--|--------|--------------------|
| (1) | $\mathbb{F}a \rightarrow (\mathbb{F}a \rightarrow \mathbb{F}a. \rightarrow \mathbb{F}a)$ | R1 | Rep |
| (2) | $\mathbb{F}a \rightarrow (\mathbb{F}a \rightarrow \mathbb{F}a. \rightarrow \mathbb{F}a) \rightarrow. (\mathbb{F}a \rightarrow. \mathbb{F}a \rightarrow \mathbb{F}a) \rightarrow (\mathbb{F}a \rightarrow \mathbb{F}a)$ | R2 | \rightarrow Dist |
| (3) | $(\mathbb{F}a \rightarrow. \mathbb{F}a \rightarrow \mathbb{F}a) \rightarrow (\mathbb{F}a \rightarrow \mathbb{F}a)$ | 1,2,R4 | MP |
| (4) | $(\mathbb{F}a \rightarrow. \mathbb{F}a \rightarrow \mathbb{F}a)$ | R1 | Rep |
| (5) | $\mathbb{F}a \rightarrow \mathbb{F}a$ | 3,4,R4 | MP |
| (6) | $\forall x(\mathbb{F}x \rightarrow \mathbb{F}x)$ | 1-5,R8 | Gen |

In this derivation, first notice that lines 1-5 simply repeat an earlier proof in AS1, where ‘ $\mathbb{F}a$ ’ is substituted for ‘ P ’. Notice, in particular, that the sequence 1-5 is a proof of ‘ $\mathbb{F}a \rightarrow \mathbb{F}a$ ’ – every line follows by a rule, and the last line is ‘ $\mathbb{F}a \rightarrow \mathbb{F}a$ ’. Accordingly, 1-5 can be used in combination with R8 (Gen) to produce line 6.

2. $\vdash \text{" } x \text{" } y(\mathbb{R}xy \textcircled{R} \mathbb{R}xy)$

- | | | | |
|-----|---|--------|--------------------|
| (1) | $\mathbb{R}ab \rightarrow (\mathbb{R}ab \rightarrow \mathbb{R}ab. \rightarrow \mathbb{R}ab)$ | R1 | Rep |
| (2) | $\mathbb{R}ab \rightarrow (\mathbb{R}ab \rightarrow \mathbb{R}ab. \rightarrow \mathbb{R}ab) \rightarrow. (\mathbb{R}ab \rightarrow. \mathbb{R}ab \rightarrow \mathbb{R}ab) \rightarrow (\mathbb{R}ab \rightarrow \mathbb{R}ab)$ | R2 | \rightarrow Dist |
| (3) | $(\mathbb{R}ab \rightarrow. \mathbb{R}ab \rightarrow \mathbb{R}ab) \rightarrow (\mathbb{R}ab \rightarrow \mathbb{R}ab)$ | 1,2,R4 | MP |
| (4) | $(\mathbb{R}ab \rightarrow. \mathbb{R}ab \rightarrow \mathbb{R}ab)$ | R1 | Rep |
| (5) | $\mathbb{R}ab \rightarrow \mathbb{R}ab$ | 3,4,R4 | MP |
| (6) | $\forall y(\mathbb{R}ay \rightarrow \mathbb{R}ay)$ | 1-5,R8 | Gen |
| (7) | $\forall x \forall y(\mathbb{R}xy \rightarrow \mathbb{R}xy)$ | 1-6,R8 | Gen |

First notice that lines 1-5 are formally similar to Example 1; this time, these lines are a proof of ‘ $\mathbb{R}ab \rightarrow \mathbb{R}ab$ ’. Accordingly, we are entitled to apply R8 (Gen), to obtain ‘ $\forall y(\mathbb{R}ay \rightarrow \mathbb{R}ay)$ ’. Next, we notice that lines 1-6 prove ‘ $\forall y(\mathbb{R}ay \rightarrow \mathbb{R}ay)$ ’, so 1-6 can be used in combination with R8 (Gen) to produce

line 7. [Notice that R8 also entitles us to infer ‘ $\forall y \forall y (Ryy \rightarrow Ryy)$ ’ at line 7; this is a harmless oddity of R8.]

3. $\{ " x(Fx @ Gx), Fa \} \vdash Ga$

(1)	$\forall x(Fx \rightarrow Gx)$	Pr
(2)	Fa	Pr
(3)	$Fa \rightarrow Ga$	1,R5 $\forall O$
(4)	Ga	2,3,R4 MP

4. $\{ " x(Fx @ Gx), " xFx \} \vdash " xGx$

(1)	$\forall x(Fx \rightarrow Gx)$	Pr
(2)	$\forall x Fx$	Pr
(3)	$\forall x(Fx \rightarrow Gx) \rightarrow \forall x Fx \rightarrow \forall x Gx$	R7 $\forall Dist$
(4)	$\forall x Fx \rightarrow \forall x Gx$	1,3,R4 MP
(5)	$\forall x Gx$	2,4,R4 MP

4. The Deduction Theorem for AS1+Q

The first major theorem is the deduction theorem for AS1+Q. We have already proven DT for AS1. This does not automatically transfer to AS1+Q. The reason is that AS1+Q has a new multi-place rule, R8, which requires us to amend the proof of DT with a special case pertaining to R8 (GEN). In the following proof, which mostly reproduces the proof of DT for AS1 [i.e., lines 1-39], ‘GEN[β]’ means ‘ β follows from previous lines by (provable) generalization (R8)’. The only genuinely new part of the proof is lines 40-43, which employ a new supporting lemma (D4).

5. Lemmas Supporting The Deduction Theorem

The proof of the Deduction Theorem appeals to five lemmas. (D1)–(D4) have already been proved in connection with SL. The remaining one – (D5) – is proven below.

- (D1) β is an axiom $\rightarrow \Gamma \vdash \alpha \rightarrow \beta$
- (D2) $\beta \in \Gamma \rightarrow \Gamma \vdash \alpha \rightarrow \beta$
- (D3) $\Gamma \vdash \alpha \rightarrow \alpha$
- (D4) $\Gamma \vdash \alpha \rightarrow (\gamma \rightarrow \beta) \ \& \ \Gamma \vdash \alpha \rightarrow \gamma \rightarrow \Gamma \vdash \alpha \rightarrow \beta$
- (D5) $\text{GEN}[\alpha] \rightarrow \vdash \alpha$

(1)	SHOW: $\text{GEN}[\alpha] \rightarrow \vdash \alpha$	CD
(2)	GEN[α]	As
(3)	SHOW: $\vdash \alpha$	4, Def(\vdash)
(4)	SHOW: $\exists \pi: \pi \text{ proves } \alpha$	7, QL
(5)	$\exists d \exists \pi \exists \mathbb{F} \exists c \exists v \{ \pi \subseteq \langle d_i: i < n \rangle \ \& \ \pi \text{ proves } \mathbb{F} \ \& \ \alpha = \forall v \mathbb{F}[v/c] \}$	2, Def GEN[]
(6)	$\pi_0 \subseteq \langle d_i: i < n \rangle \ \& \ \pi \text{ proves } \mathbb{F} \ \& \ \alpha = \forall v \mathbb{F}[c/v]$	41, $\exists O$
(7)	$\pi_0 + \langle \alpha \rangle \text{ proves } \alpha$	\natural

\natural α is clearly the last line of $\pi_0 + \langle \alpha \rangle$, so the question is whether $\pi_0 + \langle \alpha \rangle$ is a proof, which is the question whether every line follows by a rule. Let δ be a line in $\pi + \langle \alpha \rangle$. Then either $\delta \in \pi$ or $\delta = \alpha$. In the first case, by hypothesis π is a proof, so δ follows by a rule. In the second case, by hypothesis α – i.e., $\forall v \mathbb{F}[v/c]$ – follows from π by R8, so α follows by a rule.

6. The Universal Derivation Theorem

The next key task is to prove that universal derivation is an admissible rule – a result we call the Universal Derivation Theorem. [We could correspondingly call the Deduction Theorem the Conditional Derivation Theorem, since it demonstrates that conditional derivation is admissible.] Recall that the Universal Derivation show-rule (UD) tells us that showing $\mathbb{F}[c/v]$, where c is *new*, is *tantamount* to showing $\forall v \mathbb{F}$. The following theorem is the axiomatic counterpart of UD. It says that if constant c does not occur in any formula in set Γ , then if one can deduce $\mathbb{F}[c/v]$ from Γ , then one can deduce $\forall v \mathbb{F}$ from Γ . In other words,

if c does not occur in any formula in Γ , then
 if $\Gamma \vdash \mathbb{F}[c/v]$, then
 $\Gamma \vdash \forall v \mathbb{F}$

In order to simplify our notation in the proof, we employ the following shorthand, where it is understood that c is a constant, and Γ is a set of formulas.

$c \in \gamma \quad =_{df} \quad c \text{ occurs in } \gamma$
 $c \in * \Gamma \quad =_{df} \quad \exists \gamma \{ \gamma \in \Gamma \ \& \ c \in \gamma \}$
 $c \notin * \Gamma \quad =_{df} \quad \sim \exists \gamma \{ \gamma \in \Gamma \ \& \ c \in \gamma \}$

Applying this notation, and restoring all the implicit universal quantifiers, the Universal Derivation Theorem can written thus.

UDT: " Γ " \mathbb{F} " c " $v \{ c \notin * \Gamma \ \& \ \Gamma \vdash \mathbb{F}[c/v] \} \rightarrow \Gamma \vdash \forall v \mathbb{F}$

Note carefully that, just as with the Deduction Theorem (a.k.a. the Conditional Derivation Theorem), the Universal Derivation Theorem does not say that the derivation of $\mathbb{F}[c/v]$ is a derivation of $\forall v \mathbb{F}$; rather it only says that a derivation exists, without saying what the derivation looks like.

The following is a formal proof. As before,

$d \text{ D } \phi / \Gamma \quad =_{df} \quad d \text{ is a derivation of } \phi \text{ from } \Gamma$
 $d \text{ D } \phi / \Gamma / n \quad =_{df} \quad d \text{ is an } n\text{-long derivation of } \phi \text{ from } \Gamma$

- (1) **SHOW:** $\forall \Gamma \forall \mathbb{F} \forall c \forall v \{c \notin * \Gamma \rightarrow \Gamma \vdash \mathbb{F}[c/v] \rightarrow \Gamma \vdash \forall v \mathbb{F}\}$ Def \vdash

- (13) $\mid \mid \langle \mathbb{F}[c/v] \rangle \text{ proves } \mathbb{F}[c/v]$ 12, Def Ax, Def proves
- (14) $\mid \mid \langle \mathbb{F}[c/v], \forall v \mathbb{F} \rangle D \forall v \mathbb{F} / \Gamma$ \natural
- \natural By hypothesis (12), $\mathbb{F}[c/v]$ is an axiom, so the sequence $\langle \mathbb{F}[c/v] \rangle$ proves $\mathbb{F}[c/v]$, so we can apply rule R8 to this sequence to obtain $\forall v \mathbb{F}[c/v][v/c]$. But $\forall v \mathbb{F}[c/v][v/c] = \forall v \mathbb{F}$. Thus, the sequence $\langle \mathbb{F}[c/v], \forall v \mathbb{F} \rangle$ proves $\forall v \mathbb{F}$. Since every proof is automatically a derivation from any set, we have $\langle \mathbb{F}[c/v], \forall v \mathbb{F} \rangle$ derives $\forall v \mathbb{F}$ from Γ .
- (15) $\mid \mid \mid \exists d\{d D \forall v \mathbb{F} / \Gamma\}$ 14, QL
- (16) $\mid \mid \mid \Gamma \vdash \forall v \mathbb{F}$ 15, Def \vdash

7. Exercises for Chapter 16

1. Derivations (and Proofs) in Axiom System AS1+Q

Given a valid argument form, give a derivation of the conclusion from the premises **in** Axiom System AS1+Q.

2. Deduction Theorem for AS1+Q

3. Universal Derivation Theorem

2. Appendix

1. A Very General Substitution Theorem About Semantics of CFOL

We next prove a very general theorem about CFOL. It provides two different corollaries that are important in later proofs.

Th

Let \mathbb{F} be any formula. Let v_1 and v_2 be admissible valuations. Let $\langle x_1, x_2, \dots \rangle$ be a sequence of variables of \mathbb{L} , and let $\langle c_1, c_2, \dots \rangle$ be an equally-long sequence of constants of \mathbb{L} .

Suppose $\forall i: v_1(x_i) = v_2(c_i)$.

Suppose $\forall \varepsilon \{ \text{Atomic}[\varepsilon] \rightarrow \forall i[\varepsilon \neq x_i] \rightarrow v_1(\varepsilon) = v_2(\varepsilon) \}$

In other words, v_1 and v_2 agree on all symbols except (perhaps) the variables x_1, x_2, \dots . By analogy with our earlier predicate \approx , we abbreviate this as follows.

$$v_1 \approx^* v_2$$

Then:

$$v_1(\mathbb{F}) = v_2(\mathbb{F}^*)$$

where $\varepsilon^* =_{\text{df}}$ the result of substituting c_i for x_i in ε , for $i=1, 2, \dots$

Proof (by induction on formula formation):

Base Case:
